TITLE: Sensor for measuring density and small volume and weight rate-of-flow
of a liquid

SOURCE: Priborostroyeniye, no. 7, 1965, 11-13

TOPIC TAGS: densimeter, flow meter

ABSTRACT: A sensor is described which uses the principle of compensation of forces acting on a float suspended in a magnetic field. The sensor comprises: (1) the sensor proper producing a d-c signal and (2) an electrical computing circuit which segregates the signals of density and rate-of-flow. Two identical plastic floats 1 with ferrite caps 2 are suspended inside glass tubes 3 in the magnetic fields of solenoids 4. Under static conditions, the position of floats 1

Card 1/3

L-20970-66

ACCESSION NR: AP5018214

with respect to sensing coils 5 is determined by the float weight, liquid density, and solenoid current. When a liquid flows in the system, the floats are displaced, but then returned to their original position by adjusting the solenoid current. Density and volume rate-of-flow are indicated by millivoltmeters 6 and 7; mass rate-of-flow, by electrodynamic microwattmeter 8. A thermistor is used to compensate for the liquid viscosity. The sensor can be calibrated for one liquid only; other liquids require different values of circuit resistors. Orig. art. has: 2 figures, 17 formulas, and 1 table.

TITLE: The field of a lens with disturbed axial symmetry

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 32, no. 6, 1962, 695 - 705

TEXT: The field of an electron lens in which the circular symmetry of the electron trajectory is no longer conserved is calculated. The concrete example of a lens consisting of two elliptical cylinders face to face is considered. The results of exact analytical calculations are compared with the results obtained with the aid of perturbation theoretical calculations. The perturbation theoretical results are true only if the perimeter of the ellipse is equal to that of the ideal circular lens. Numerical calculations were also performed. The ellipticity causes a paraxial astigmatism. This kind of aberration is proportional to the aperture and to the ellipticity. There are 4 figures and 2 tables. ✓

Abstract : It was demonstrated that biomycin (I) produces good therapeutic and prophylactic results in pasteurellosis of poultry. In pasteurellosis of cattle, (I) produces a curative effect when it is used in a 3 mg/kg dose (injected intraabdominally). Most effective is simultaneous administration of (I) and antipasteurellosis serum. The author recommends that the opsonocyphagic

TITLE

The Concepts of Tension and Induction of a Magnetic Field
(Ponyatiya napryazhennosti i induktsii magnitnogo polya)

PERIODICAL:

Fizika v shkole, 1958, Nr 6, pp 39 - 42 (USSR)

ABSTRACT:

The difficulty in expounding the concepts of a magnetic field's tension and induction in the 10th class is due to the facts that the methods of studying these concepts have not been developed, there is a lack of demonstration experiments, and a wrong interpretation of the quantities B and H is given in the physics textbook. The concept of induction can be introduced in the secondary school by taking the magnetic field's action under current as a basis. This method of introduction has the advantage of creating an analogical approach for the study of electric and magnetic fields. The concept of the magnetic field's tension is introduced by showing the magnetic field's action on the standard pointer. Suitable indicators are required. The author gives a description of a strength and of an induction indicator. Both indicators are made on non-magnetic materials

Card 1/2

TITLE: On the Contents of Physics Textbooks in Connection With Questions of Polytechnical Instruction (O sodержanii kursa fiziki v svyazi s voprosami politekhnicheskogo obucheniya)

PERIODICAL: Fizika v Shkole, 1958, Nr 3, pp 40-41 (USSR)

ABSTRACT: Although the author shares the opinion of V.F. Yuskovich that there is no urgent necessity to abandon the present school program in physics, he admits that the existing teaching system is below the standard required. A diligent student instructed by a good teacher at a school with good physics studies will not be prepared to master the modern techniques. The author counts up many deficiencies in physic courses and mentions also the insufficient number of lessons provided for physics. Because of this, the teacher cannot carry out the program and cannot convey a thorough knowledge to his students. The present situation demands suitable measures to ensure normal conditions in the instruction of physics.

TITLE: Installation for Studying the Interaction of Parallel Currents

PERIODICAL: Fizika v shkole, 1959, Nr 3, pp 69-71 (USSR)

ABSTRACT: The author describes an installation assembled by himself, the use of which at secondary schools would permit the study of quantitative correlations of parallel electric currents and would facilitate the study of the subject "Magnetic Fields". The installation is simple and consists of devices taken from the physics laboratory of a school and two homemade frames 100 mm x 200 mm in size (each with 30-40 spires of 0.5 mm insulated wire. Moreover, it is necessary to prepare about one liter of a paramagnetic liquid. The diagrams give a general view of the installation and the working principle. Ampere meters are necessary for measuring the current in the

Card 1/2

SOV/47-59-3-18/53

Installation for Studying the Interaction of Parallel
Currents

frames, and rheostats for changing it. The resistance of the 25 to 30 ohm rheostats is suitable for current up to 5 amperes. As an energy source, two alkaline accumulators "5NKM-22" may be used. The author gives a full demonstration (many formulae) of the possibilities afforded by the installation. In connection with the aerodynamic balance designed by "IMO APN RSFSR" (at present produced by the workshops of the 315th school of Moscow), intended for determining the relative values of interaction (no absolute values are required), the author mentions S.A. Shurkhin, who developed them. There are 2 diagrams.

TITLE: Removal of Cuttings from Drilling Water in a Pond (Ambarnaya
ochistka promyvochnoy vody)

PERIODICAL: Neftyanik, 1953, Nr 5, p 7 (USSR)

ABSTRACT: The author states that a complete removal of cuttings from industrial water used as drilling fluid cannot be ensured by the existing system of troughs even if the latter is equipped with a separator (Fig. 1). Only large size cuttings can be removed, while small cuttings are entrained by the liquid, and come back through the pump to the bore-hole. However, the newly developed system ensures the complete removal of cuttings (Fig. 2). All the drilling fluid coming from the bore-hole is directed to the 1000-1500 cu. m. capacity pond, where the fluid is screened. The drilling results which were obtained by the Belebeysk drilling office of the Bashrapadneterazvedka trust are listed in a table. These results depend upon the completeness of the removal of cuttings from the drilling fluid. This table shows that the per bit footage and the mechanical drilling speed increased after the

TITLE: Determination of the energy required to separate an electron-hole pair in CdS single crystals irradiated with electrons of energy 5 - 50 keV

SOURCE: Fizika tverdogo tela, v. 8, no. 10, 1966, 3133-3135

TOPIC TAGS: electron hole, electron energy, stimulated emission, electron bombardment, photoconductivity, electric conductivity, forbidden band

ABSTRACT: In view of the fact that earlier investigations have neglected the question of the energies required to produce or separate electron-holes, and knowledge of these energies is important in connection with the use of electron beams to produce stimulated emission in semiconductors, the authors have determined the electron-hole separation energy ϵ in single-crystal CdS bombarded with electrons of 5 - 50 keV energy. They were able to measure ϵ with sufficient accuracy only by using single crystals with a specific nonselective spectral photoconductivity characteristic obtained through a special heat treatment. The method of determining ϵ is based on comparison of the stationary values of the photo- and electron-conductivity in the same crystal. The

Card 1/2

ACC NR: AP6033585

measurements were made in vacuum of 10^{-5} mm Hg at room temperature. The value of $3E$ ($E = 7.5 \pm 0.8$ ev is obtained in this manner for ϵ , which is found to be equal also to the forbidden band width). The same ratio of ϵ to E was obtained by others for a number of semiconductors and agrees with the approximate theoretical model proposed by W. Shockley. Orig. art. has: 1 figure and 1 formula.

TITLE: Automatic non-contact regulator for controlling the electric cycle of furnaces for flux remelting 4

SOURCE: Ref. zh. Metallurgiya, Abs. 12B131

REF SOURCE: Elektrotermiya. Nauchn.-tekhn. sb., vyp. 44, 1965, 17-19

TOPIC TAGS: automatic regulation, metal melting, metallurgic furnace, electric relay, power amplifier, electrode, electric transformer, electronic circuit

TRANSLATION: The Zaporozh'ye Affiliate of the Institute of Automation and the Dneprospetsstal' Plant have developed a non-contact regulator for controlling the electric cycle for flux remelting in consumable-electrode furnaces. The regulator maintains working current of electrode with an accuracy of 1.5% of nominal. An input signal proportional to electrode current is received by current transformer and fed to a comparison circuit where it is compared with a voltage which is proportional to the setting of the electrode working current. The difference between these voltages is fed to a semiconductor relay which operates a magnetic power amplifier. This amplifier controls the motor which moves the electrode. A

Card 1/2

UDC: 669:621.365:681.1/2

schematic diagram of the regulator is given together with an explanation of its operation. The regulator has been in continuous operation at the Dneprospetsstal' plant for a year and a half. During that time, the unit has been used in making more than 1,000 melts which have shown that the regulator is reliable in operation, simple to use, and eliminates metal rejects due to excessive deviations in electrode current during melting. PHASE I BOOK EXPLOITATION

Spivakovskiy, Aleksandr Onisimovich, Nikolay Deonidovich Samoylyuk, G. I. Solod, and Lev Grigor'yevich Shakhmeyer

Podzemnyye konveyernyye ustanovki (Underground Conveyer Installations) Moscow, Gosgortekhzizdat, 1960. 478 p. Errata slip inserted. 5,000 copies printed.

Resp. Ed.: A.O. Spivakovskiy; Ed. of Publishing House: A.D. Kolomeytsev; Tech. Eds.: V.L. Prozorovskaya and Z.A. Boldyreva.

PURPOSE: This book is intended for engineering and technical personnel of the mining industry engaged in designing and operating underground conveyers; it may also be useful to students of mining institutes and mining technicians.

COVERAGE: The book describes underground conveyers used in the mining industry in the USSR and abroad and the construction of their most important individual subassemblies and elements; the fundamentals of theory and calculations of underground scraper conveyers, belt conveyers, slat conveyers, and combined conveyers (new chain-belt and rope-belt conveyers) are discussed and basic reference material regarding USSR underground conveyers is presented.

-Ground Conveyor Installations

SOV/5431

The first part of the book was written by N.D. Samoylyuk, Candidate of Technical Sciences; the second part by L. G. Shakhmeyster, Candidate of Technical Sciences; the third by G. I. Solod, Docent, Candidate of Technical Sciences; and the fourth by A.O. Spivakovskiy, Professor. Section 4 of Ch. VII (Part II) was written by O.G. Karbasoviy, Aspirant. There are 72 references: 53 Soviet, 10 English, 8 German, and 1 French.

TITLE: Exchange of Experience in Teaching Safety Engineering Rules
(Obmen opytom obucheniya pravilam tekhniki bezopasnosti)

PERIODICAL: Vestnik svyazi, 1958, Nr 12, pp 26-27 (USSR)

ABSTRACT: The RSFSR Ministry of Communications conducted an inter-oblast' conference on teaching safety engineering rules. Supervisors and chief engineers of wire broadcast networks, construction organizations, line service shops and communication offices participated in this conference. The conference heard a report of O.A. Khitrinskiy, chief engineer of the Glavnoye upravleniye radiofikatsii i vnutrirayonnoy elektrosvyazi (Main Directorate of Wire Broadcasting and Intra-Rayon Electrical Communication Facilities) of the RSFSR Ministry of Communications on production traumatism. A.L. Yurchenko, B.A. Serebryannikov, T.G. Melenkin and A.D. Chistikov reported on safety engineering within their organization. It was pointed out that many linemen ignore safety regulations and a document was demanded which is to be issued to linemen only after they

~~TITLE:~~ Progressive Service Methods on Municipal Wire-Broadcast Networks

PERIODICAL: Vestnik svyazi, 1959, Nr 6, pp 24-25 (USSR)

ABSTRACT: Two new service methods are discussed. The one "method of separate service of networks" consists in repairing the damages to the network by the emergency repair service, instead of by the "exploitation surveyors" as before. The Leningradskaya gorodskaya radiotranslyatsionnaya set' (Leningrad City Wire-Broadcast Network) initiated this system with good results. It is also used in Moscow, Kazan', Novosibirsk, and in other cities. The RSFSR Ministry of Communications has recommended it for use in all town networks with more than 10,000 radio points, and to overhaul the points in a two-year cycle, i.e. 50% of them every year. To increase the work efficiency of overseers, a task-rate pay system is being considered for them, and has been
